Level I Trauma Center Studies Characterizing Dog Bite Injuries Across Major U.S. Geographical Regions (2011-2021)

Summary

Table 1. From 2011 to 2021, 16 peer-reviewed scientific medical studies from Level I trauma centers spanning all major geographical regions in the United States—Northeast, Southeast, South, Southwest, Midwest, West Coast and Northwest—all report similar findings. Pit bulls are inflicting a higher prevalence of injuries than all other breeds of dogs. The majority of these studies (13 of 16) also report that pit bulls are inflicting the most severe injuries, requiring a higher number of operative interventions—up to five times higher—than other dog breeds.

Table 2. Four studies from this period—all from Level I trauma centers in the Denver metro area—show a mixture of results, possibly due to Denver and the surrounding metropolitan regions enforcing pit bull bans from 1989 to 2020.

Criteria for inclusion in this trauma study table requires being a multi-year retrospective study of U.S. Level I trauma center dog bite patients (≥ 15 patients), published from 2011 to 2021, the inclusion of dog breed information, and the scientific research conducted by medical doctors.

<td>Study period:</td>
<td>Southeast - Pediatric Level I trauma center - Richmond, Virginia</td>
<td>356 pediatric patients studied. Patient ages 6-12 suffered the most injuries, 45.7%. Pit bulls inflicted the highest prevalence of injuries, 53%, when breed was known and 29.8% of cases studied. Pit bulls were more likely to bite ages 6-12 (36.2%). Huskies were more likely to bite infants (5.9%).</td>
<td>Facial injuries were the most common, 56.2% followed by extremities, 37.1%. Infants and preschoolers were more likely to sustain bites to the head/face. Approximately 25% of the patients required advanced reconstructive techniques.</td>
<td>1</td>
</tr>

Findings: “Most pediatric dog bite injuries afflicted male children (55.6%), ages 6 to 12 years (45.7%), by a household dog (36.2%). The most common offending breed was a pit bull or pit bull mix (53.0%) ... Other frequently identified breed groups included Labrador/Labrador mix (10%), German Shepherd/German Shepherd mix (6.5%) ... Specific dog breed was not associated with need for surgical repair or location of surgical repair.”
### Selected Findings: 

“The most commonly reported dog breeds for both groups were Pit Bull Terriers (25 patients, or 22%), followed by a mixed breed dogs (16 patients, 14%).”

“The most commonly reported breed among these fracture patients was the Pit Bull Terrier: a breed which has been previously identified as particularly high risk for aggressive and destructive behavior.”

### Findings: 

“The data showed that compared with other dog breeds, pit bull terriers inflicted more complex wounds, were often unprovoked, and went off property to attack ... The probability of a bite resulting in a complex wound was 4.4 times higher for pit bulls compared with the other top-biting breeds ... and the odds of an off-property attack by a pit bull was 2.7 times greater than that for all other breeds.”

### Findings: 

“Parental presence was reported in 43.6% of cases, and most attacks occurred in the evening (46.8%). Injuries often involved the head–neck region (92.1%), and 72.5% were
of major severity.”

“The most commonly identified breed was the pit bull, followed by the Labrador retriever. Pit bulls were also the most commonly identified breed involved in major injuries.”

<td><strong>West Coast</strong></td>
<td>2010-2014</td>
<td>189 patients studied, all adults ≥ 18. Breed identified in 61 cases, 32.2%. Pit bulls inflicted the highest prevalence of injuries, 47.5% (29), when breed was known and 15.3% of total studied.</td>
<td>Pit bulls were responsible for 36.8% of head and neck injuries when breed was known (7/19). 65.5% of pit bull attacks involved the extremities. Other dog breeds were more evenly distributed.</td>
</tr>
<tr>
<td><strong>Midwest</strong></td>
<td>2002-2017</td>
<td>Meta-study analysis conducted across 43 studies (1970 to current) to determine breed prevalence in all bites. Pit bulls were responsible for the highest percentage of reported bites across all the studies (22.5%) followed by mixed-breed (21.2%) and German shepherds (17.8%).</td>
<td>240 pediatric patients studied -- head, neck injuries only. Each patient characterized into an ordinal scale of bite injury. Mixed-breeds and pit bulls had the highest relative risk of biting, and also had the highest average tissue damage per bite.</td>
</tr>
<tr>
<td><strong>West Coast</strong></td>
<td>2010-2016</td>
<td>95 patients studied -- orthopaedic injuries requiring specialized treatment only. Pit bulls inflicted the highest prevalence of injuries, 50% (47), followed by law enforcement dogs, 22% (21), of total studied. Breed was</td>
<td>Pit bulls were responsible for 78% of all amputation injuries. Of those bitten by pit bulls, 51% had a bony injury. Bites from law enforcement dogs resulted in 24% bony injuries. 66% of pit bull bite patients (31/47)</td>
</tr>
</tbody>
</table>

**Published:** May 2019  
**Study period:** 2010-2014  
**C. Lee**

**Results:** “The most common breed of dog identified was pit bull (n = 29, 47.5%). The majority of pit bull attacks involved the extremities (65.5%) compared to other breeds of dogs. Pit bull victims were noted to have a lower average annual income compared to other breed victims ... However, this was not statistically significant (0.16).”

**Published:** Feb. 2019  
**Study period:** 2002-2017  
**G. Essig Jr.**

**Findings:** “Injuries from pit bulls and mixed-breed dogs were both more frequent and more severe ... Physical characteristics like brachycephalic head shape and weight between 66 and 100 pounds were found to have both the highest bite risk and highest average tissue damage per bite.”

“We recommend separating children from high-risk breeds and high-risk phenotypes reported in this study. Selecting for animals with low risk for biting and tissue damage may lower the risk injury.”

**Published:** Sep. 2018  
**Study period:** 2010-2016  
**J. Brice**

**DogsBite.org:** Some dogs don’t let go.
Conclusions: “Thirty-nine percent of all dog bite-related emergency department visits at our facility resulted in an injury requiring orthopaedic treatment. Pit bull terrier bites were responsible for a significantly higher number of orthopaedic injuries and resulted in an amputation and/or bony injury in 66% of patients treated, whereas bites from law enforcement dogs and other breeds were less associated with severe injuries.”

Findings: “Our study corroborates much of the previous literature, supporting the notion that pit bull bites are severe enough to require operative intervention more frequently than the bites of other dog breeds. Indeed, when looking at cases that required operative interventions, pit bulls were disproportionately represented in 62.5% of cases.”

Findings: “Of the 56 cases that had an identified dog breed, pit bulls accounted for 48.2% of the dog bites. More importantly, 47.8% of pit bull injuries required operative repair, which was 3 times more than other breeds.”

“Of the 9 patients with extended hospitalization, 6 (66.7%) were caused by a pit bull that confirms our theory that this breed results in the most devastating injuries at our center. The penetrating and crushing nature of these bites can lead to lifelong deformities.”
### Findings:

“Pit bull bites were implicated in half of all surgeries performed and over 2.5 times as likely to bite in multiple anatomic locations as compared to other breeds.”

“Our data were consistent with others, in that an operative intervention was more than 3 times as likely to be associated with a pit bull injury than with any other breed.”

### Published: Jul/Aug 2016

**Northwest - Regional Level I trauma center - Seattle, Washington**

342 patients studied. Breed identified in 270 cases, 79%. Pit bulls inflicted the highest prevalence of injuries 27% (92) of total studied and 25% (22.7) of all ocular injuries. Among dogs unknown to patients, pit bulls inflicted 60% of all injuries and 63% of ocular injuries.

5 patients (1.5%) ages < 7 sustained facial fractures. 3 sustained orbital fractures inflicted by a doberman, husky and Labrador, 1 sustained a nasal bone fracture by a pit bull, and 1 sustained a depressed skull fracture by a German shepherd.

### Findings:

“Importantly, this study is the first to accurately establish that pit bulls are the breed most commonly associated with ocular injuries (25%). Most alarming is the observation that when attacks come from unfamiliar dogs, the pit bull was responsible for 60% and 63% of all injuries and ocular injuries, respectively.”

### Published: May 2015

**Southeast - Level I trauma center - Knoxville, Tennessee**

20 patients studied -- head, neck and facial injuries only treated by oral and maxillofacial surgery. Breed identified in 16 cases, 80%. Pit bulls inflicted the highest prevalence of injuries, 56% (9), when breed was known and 45% of total studied.

Pit bulls were more frequently associated with injuries than other dog breeds (9/20). Two cases involved multiple dogs, all of which were pit bulls. A pit bull inflicted the only fatality.

### Results:

“The medical records from 20 patients were included and reviewed. More than one half (60%) of the patients were younger than 12 years old. The dog was owned by the patient or a relative in 58% of the cases. The children sustained injuries requiring hospital admission and repair in an operating room setting more often than did the adults. Pit bulls were more frequently associated with injuries than other breeds (9 of 20).”

### Published: Feb. 2015

**Southwest - Pediatric Level I trauma center - Phoenix, Arizona**

282 pediatric patients studied. Breed identified in 213 cases, 75.5%. Pit bulls inflicted the highest prevalence of injuries, 39% (83), when breed was known and 29.4% of total studied.

Among the 11 patients with the highest AIS (3–5), pit bulls were responsible in 45.5% of cases. Pit bulls also accounted for 38% of all head, neck or facial bites.
**Findings:** “Pit bulls were most frequently responsible, accounting for 39% (83/213) of incidents in which dog breed was documented ... Among the 11 patients with the highest AIS (3–5), Pit bulls were responsible in 45.5% of cases, followed by mixed-breeds in 18.2% (2/11) of cases. Pit bulls were also responsible for 38% of all head, neck or face bites.”

“Dog familiarity did not confer safety, and in this series, pit bulls were most frequently responsible. These findings have great relevance for child safety.”

**Findings:** “Bites from large-breed dogs, especially pit bull-type dogs and rottweilers are more likely to result in more severe injuries, subsequent medical care and report, which may over-represent those breeds among biting dogs -- in other words, creating reporting bias. However the severity of injury necessitating medical attention should not be overlooked when considering the breed of dog generating more severe injuries.”

**Results:** “Of the more than 8 different breeds identified, one-third were caused by pit bull terriers and resulted in the highest rate of consultation (94%) and had 5 times the relative rate of surgical intervention. Unlike all other breeds, pit bull terriers were relatively more likely to attack an unknown individual (+31%), and without provocation (+48%).”

---

*DogsBite.org*: Some dogs don’t let go.
Conclusions: “Attacks by pit bulls are associated with higher morbidity rates, higher hospital charges, and a higher risk of death than are attacks by other breeds of dogs. Strict regulation of pit bulls may substantially reduce the US mortality rates related to dog bites.”

Level I Trauma Center Studies Characterizing Dog Bite Injuries in Denver, Colorado Region (2013-2017)

Summary

In October 1989, the city and county of Denver adopted a pit bull ban. Notably, in 1994, one of the first epidemiological studies of “breeds of biting dogs” was carried out in the county of Denver, despite the absence of pit bull terriers due to the ban (Which Breeds Bite? A Case-Control Study of Risk Factors). As a result, pit bulls did not appear in the case-control study’s “biting” or “nonbiting” breed findings (Gershman, 1994).

From 2013 to 2017, one of four Level I trauma center studies in the Denver metro area showed that pit bulls continue to have a high prevalence of facial injuries (Gurunluoglu, 2014). Another study, also limited to facial injuries, states that while the prevalence of pit bull injuries was low during their study period (2003-2008), the severity of pit bull injury included, “the patient who suffered the most extensive injuries and the longest hospitalization of our entire population” (Chen, 2013).

On November 3, 2020, Denver voters repealed the city’s longstanding pit bull ban and replaced it with a provisional “breed-restricted license” ordinance. The new law requires pit bull owners to register and microchip their dogs and limits the ownership of pit bulls to two per household.

**Study period:** 2006-2012  

**Published:** Dec. 2013  
**Study period:** 2003-2008

---

**Findings:** “Ninety-eight wounds in the head and neck region were repaired. Twelve different breeds were identified. There was no significant association between the type of dog breed and the number of bite injuries ... There was no statistically significant association between wounds needing reconstruction versus direct repair according to dog breed.”
Findings: “Seventeen of 1,201 (1.4%) children with dog bite injuries to the face also sustained facial fractures. The average age of patients was 3.9+/−3.2 years and 53% were female. Thirty-five percent of patients presented with multiple facial fractures ... Almost a quarter (4 of 17, 23.5%) of the attacking dogs that caused facial fractures were German Shepherds,” followed by pit bulls with 17.6% (3 of 17).
